## **See all 715 actual trades here**

We started the year buying calls in January right up to the January 26<sup>th</sup> high and we ended the year buying puts and making money on those puts right up to an including the last trading day (an up day at that) of the year December 31, 2018.

It was a good year. Heck it was a great year, we killed it! Sure we had some options go to zero, that happens. And our Account #1 even moved into negative territory July – September. But we had a great October (that account made a 72.49% gain for the month and 82.33% for the last quarter) and finished out the year with great gains. Believe it or not, we played relatively conservatively (if you can call buying options conservative), usually buying our options in pairs. When we were right, we took profits on one option

(game plan is to at least double our money) and then let the other option run.

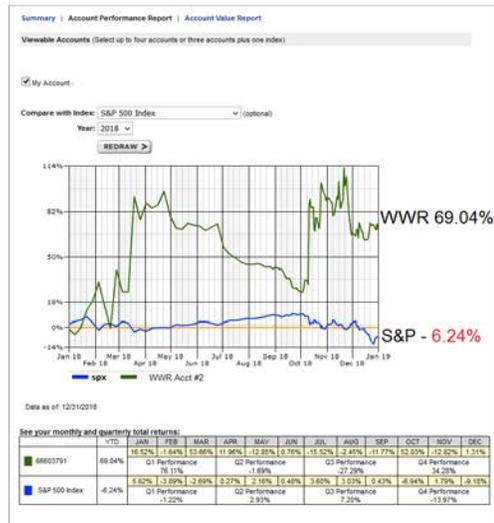

We traded account #3 through March 5 and stopped after that as we realized trading in 3 different accounts at the same time was proving to be difficult at best. Therefore results for account #3 are for the first three months of the year.

Here's hoping you and yours have a happy, safe and prosperous new year in 2019.

\*Investment results are historical. Past Performance is not an indicator of future results. The investment performance figures presented on the E\*TRADE FINANCIAL Web site are an estimate of aggregate security performance and are calculated nightly using the time-weighted performance method. The performance figures will provide the user with a compounded percentage rate of return for an account (stocks, bonds, options, mutual

funds, money market, etc.) Investment performance is calculated net of commission expense. Because the time-weighted performance method is used, any customer-initiated deposits made to the account should not increase account performance, and any customer-initiated withdrawals made from the account should not decrease account performance. The performance information should not be considered tax advice and should not be used for tax purposes. The results shown do not include the effects of gains or losses that may have occurred in your portfolio outside the date range you selected.

Time-weighted Performance Method - A method of calculating the compound growth of a portfolio that eliminates the distorting effects of money flowing into and out of the portfolio. With the method, the effect of cash flows is eliminated by assuming a single investment at the beginning of a period and calculating the average annual total return to the end of the period.

### ***Positions for rating services:***

***Long-term*** counts are found on weekly and/or monthly charts and generally cover a time period of years to decades.

***Intermediate-term*** counts are found on daily and/or weekly charts and generally cover a time period of weeks to years.
